1. What is React

-) React is a JS library used for building UI, especially for single page web without reloading

2. React is a library not a framework

3. Features of React.

-) Component Based architecture
-) Virtual DOM
-) JSX
-) One way Data Binding
-) Declarative UI
-) Hooks
-) Strong community and ECO System

4. SPA

-) Single Page Application is a web app where the page does not reload when navigate between sections

5. Component:

→ It is a reusable block of code that returns UI elements in react applications

6. Functional Components

→ A functional component is a JS function that returns JSX to render UI

↓

JS returning HTML

7. JSX

→ JavaScript XML

→ It is a syntax that allows writing HTML inside JS in React

8. → No browsers cannot understand JSX directly

→ It must be transpiled into JS.

9. Babel:

→ It is a compiler / transpiler which converts JSX into ~~JS~~ browser compatible JS.

10. Virtual DOM

→ It is a representation of Real DOM that react uses to update UI efficiently

→ It updates only the necessary parts
